

PUBLIC ENTITY

System Security Standards Guidelines for Cyber Quotes

Bulletin #1 | October 2021

As the cyber insurance market continues to harden, we prepared this summary of minimum security standards needed by the marketplace to obtain a quote. Please note that each underwriter has its own nuances; however, this list captures the general marketplace.

- » Multi-factor authentication 100% implemented for:
 - » Remote access
 - » Laptops
 - » Privileged access
- » End-point protection, detection, and response product implemented across enterprise with 24/7/365 response
- » If Remote Desktop Protocol connections enabled, the following are implemented:
 - » VPN access only
 - » MFA for access
 - » Network level authentication enabled
 - » Remote Desktop Protocol Honeypots
- » Backups
 - » 1 working copy, 1 offsite, disconnected not working, 1 onsite disconnected not working
 - » Tested at least twice a year
 - » Ability to bring up within 24-72 hours less time for critical operations (4 hours)
 - » Protected with antivirus or monitored on a continuous basis
 - » Encryption
- » Planning and Training:
 - » Incident Response Plan
 - » Business Continuity Plan
 - » Social Engineering Training
 - » Phishing Training
 - » Training of account team staff on fraudulent transactions
 - » General cyber security training
- » Critical & high severity patches installed within 30 or fewer days, optimally within 1-7 days
- » Plan or adequate measures in place to protect end of life software

For more detailed information please see the following document from Beazley Ins. Co. This and other useful materials related to Public Entity Cyber insurance products can be found on the Public Entity Cyber Corner on AlliantNet.

Alliant note and disclaimer: This document is designed to provide general information and guidance. Please note that prior to implementation your legal counsel should review all details or policy information. Alliant Insurance Services does not provide legal advice or legal opinions. If a legal opinion is needed, please seek the services of your own legal advisor or ask Alliant Insurance Services for a referral. This document is provided on an "as is" basis without any warranty of any kind. Alliant Insurance Services disclaims any liability for any loss or damage from reliance on this document.

Protecting your organization against ransomware

Minimum protection

- Deploy and maintain a well configured and centrally managed End-Point Protection (EPP) solution: A robust EPP/anti-virus solution is a basic component of any security program.
- Email tagging: Tag emails from external senders to alert employees of emails originating from outside the organization.
- Email content and delivery: Enforce strict Sender Policy Framework (SPF) checks for all inbound email messages, verifying the validity of sending organizations. Filter all inbound messages for malicious content including executables, macro-enabled documents and links to malicious sites.
- Office 365 add-ons and configuration: Enable two-factor authentication (2FA) on Office 365 and use Office 365 Advanced Threat Protection.
- Macros: Disable macros from automatically running. Ideally disable them from running at all if your business does not need them.
- Patching: Conduct regular vulnerability scans and rapidly patch critical vulnerabilities across endpoints and servers – especially externally facing systems.
- Remote Access: Do not expose Remote Desktop Protocol (RDP) directly to the Internet. Use Remote Desktop Gateway (RDG) or secure RDP behind a multi-factor authentication-enabled VPN.
- Media usage controls: Put in place controls on the insertion and/or use of media which does not carry appropriate authentication/media identifiers.
- Well-defined and rehearsed incident response process: Helps mitigate losses and rapidly restore business operations after a ransomware attack.
- Back-up key systems and databases: Ensure regular back-ups which are verified and stored safely offline.
- Educate your users: Most attacks rely on users making mistakes, train your users to identify phishing emails with malicious links or attachments. Regular phishing exercises are a great way to do this.
- Firewalls: Use network and host-based firewalls with well considered rule-sets, for example, disallow inbound connections by default.

Stronger protection

- Establish a secure baseline configuration: Malware relies on finding gaps to exploit. A baseline configuration for serves, end-points and network devices that conforms to technical standards such as Center for Internet Security (CIS) benchmarks can help plug those gaps.
- Filter web browsing traffic: Web filtering solutions will help prevent users from accessing malicious websites.
- Use of protective DNS: Helps deny access to known malicious domains on the Internet.
- Manage access effectively: Ransomware doesn't have to go viral
 in your organization. Put in place appropriate measures for general
 user and system access across the organization: privileged access for
 critical assets (servers, end-points, applications, databases, etc.) and
 enforce multi-factor authentication (MFA) where appropriate (remote
 access/VPN, externally facing applications, etc.)
- Regular testing of back-ups: Reduces downtime and data loss in the case of restoring from back-ups after a ransomware attack.
- Disconnect back-ups from organization's network: Prevents backups from being accessed and encrypted by ransomware in case of a successful attack on an organization's main network.
- Separately stored, unique back-up credentials: Prevents bad actors from accessing and encrypting back-up data.

Best protection

- End-point detection and response (EDR) tools: EDR solutions
 monitor servers, laptops, desktops and managed mobile devices for
 signs of malicious or unusual user behavior/activity. These tools also
 enable near immediate response by trained security experts. When
 effectively deployed and monitored, EDR tools are one of the best
 defenses against ransomware and other malware attacks.
- Intelligent email evaluation: Automatically detonate and evaluate inbound attachments in a sandbox environment to determine if malicious prior to user delivery.
- Centralized log monitoring: Centralized collection and monitoring of logs, ideally using a Security Information and Event Management (SIEM) system, identifies threats which breach your internal defenses.
- Subscription to external threat intelligence services: Provides
 access to external services that can provide details of developing
 attacker tactics, techniques and procedures. They also provide access
 to databases of known bad websites, mail attachments, etc.
- Encrypted back-ups: Prevents use of back-up data by bad actors.
- Network segregation: control access and/or traffic flow within the network environment. A well-configured firewall rule set will ensure that only the required traffic can flow from one segment to another. Furthermore, segregate end of life/support systems/software as a priority.
- Web isolation: Use of a web-isolation and containment technology to create a secure Internet browsing experience for your users.
- Application permissions: Only permit applications trusted by your organization to run on devices.

Lodestone Security can help you make impactful changes to your security posture to either prevent breaches before they occur or prevent recurrences. For additional information:

James Habben – Director, Business Development info@lodestonesecurity.com

KPMG offers a wide range of services to help organizations defend against and respond to ransomware attacks. To discuss how they can help please contact:

Matthew Martindale – Partner, Cyber Security cyber@kpmg.co.uk
